Before AutoCAD Full Crack, CAD engineers and drafters who needed to create drawings of two-dimensional (2D) objects used their knowledge of paper drafting to create them. Paper draftsmen would trace out the shape of the object they were working on, trace it again to check that it had been done correctly, and then trace it once again to produce the final drawing. The

---

process was laborious, and CAD software was being developed to take the place of paper drafting. After the development of AutoCAD, it became possible to create 2D drawings on the computer instead of by hand. Its graphics capabilities enabled a CAD operator to use any of a number of techniques to create a 2D drawing, including tracing, rasterization, and vectorization. Tracing involves a user drawing the lines and shapes of an object in screen coordinates, rasterization involves drawing lines or

---

shapes of an object by filling a digital canvas with predefined colors, and vectorization involves producing an image by mathematically specifying the coordinates of each point on the object being drawn. The development of CAD software enabled CAD operators to create drawing objects and even insert them into layouts and drawings without ever leaving the computer. When finished, a CAD operator can save a drawing or export it to a file on a disk drive or send it directly to a printer. The advent of CAD software also

---

affected the way in which 3D models are created. Before CAD software, the main way of creating 3D models was through computer-aided design. CAD programs facilitated the process of creating 3D models by helping CAD operators to make design decisions, as well as aiding them in the modeling process by showing them how to create 3D objects. CAD also had a considerable effect on the way in which 3D objects were displayed. Before CAD, it was hard to display 3D objects in 3D space as 3D shapes were

---

created by a draftsman, the 3D modeler, who would trace out the shape of the object in screen coordinates. Once the 3D model had been created, the draftsman would then trace it again to check that it had been done correctly, and then trace it once again to produce the final 3D model. With CAD, 3D modeling became much easier. CAD operators could use a variety of tools to create 3D models quickly and easily, and the tools themselves would then display a 3D model for the CAD operator to view in 3D space. With CAD, a
