Epigenetics is a new scientific field that deals with the changes in gene expression that occur without altering the DNA sequence, as the result of inter-generational interactions or environmental stimuli. Epigenetic regulation of gene expression may be involved in many diseases (e.g., cancer), as well as in aging and the aging process itself. Since heritability is an important

aspect of aging research, epigenetic processes might play a role in the changes that lead to increased risk of diseases, and thus, increased mortality, as age increases. Our preliminary data suggest that DNA methylation may be involved in the stress response and hence may be altered during aging, and that there may be inter-individual
