1. Field of the Invention The present invention relates to an exhaust gas recirculation system (hereinafter, referred to as an EGR system) for recirculating an exhaust gas into an intake air passage of an internal combustion engine.

2. Description of the Related Art The following description sets forth the inventor's knowledge of related art and problems therein and should not be construed as an admission of knowledge in the prior art. In the conventional EGR system, as disclosed in, for example, Japanese Patent Laid-Open Publication No. Hei. 7-114979, in order to increase an EGR effect, it is necessary to set a flow rate of a part of a recirculated exhaust gas (e.g., an exhaust gas recirculation amount) in accordance with an engine operating condition. More specifically, in the case of a high engine speed condition, it is necessary to reduce a part of the EGR amount. As a method for reducing an EGR amount in accordance with a vehicle operating condition, the following two methods have been known. (1) In accordance with a fuel injection amount, a valve opening degree is controlled, and an EGR rate is changed according to the valve opening degree (e.g., Japanese Patent Laid-Open Publication No. Hei. 5-299696). PA1 (2) In accordance with an accelerator position, a part of an EGR amount is reduced (e.g., Japanese Patent Laid-Open Publication No. Hei. 6-135532). PA1 (1) In accordance with the rotational speed of the engine, the EGR rate is changed. PA1 (2) In accordance with the intake air pressure, the EGR rate is changed. PA1
