Recording capturing each player's movements, Rob Kinnan investigated what it would take to create the best-in-class player motion on-disc. The capture process involved three cameras: one placed on each player's feet, a second camera on a 3-D camera head mounted on the player's helmet and third camera on his chest. It worked, in part, by having the player wear a suit made by Sportizm with markers on it to track movement. The result is a state-of-the-art, comprehensive and responsive player motion engine. There were a lot of considerations to ensure that on-disc players would match the experienced players who were already playing EA Sports' FIFA soccer videogame. And they did. "We're looking at things like, 'How might they catch the ball with their chest?' or 'How might they cut behind someone?' or 'How might they hit a cross or run a pass?'" says Kinnan. "We're trying to get that natural feel back into soccer games." In our technology preview, we got to see how Kinnan took a set of player motions recorded on on-disc and recreated them on the disc at a 20 frames-per-second rate. It's an impressive feat. Powering the hyper-powered FIFA 22 engine To ensure that FIFA 22's on-disc players would deliver the same feel as the EA Sports' high-end experience, Kinnan started with the data collected from the real-life players during the process of recording and capturing the player motion. "We had their entire movement," Kinnan explains. "We've got all their data. And then we use that data to tell the engine, 'OK, now this player has done this, this, this, this. This is his height, his weight, his shape, his speed, what he's done just now, we know how he does that in the game." Kinnan says. "We're looking at things like, 'How might they catch the ball with their chest?' or 'How might they cut behind someone?' or 'How might they hit a cross or run a pass?'" By developing what they saw in the recordings, Kinnan and his team began to implement their experience into the engine. And they needed to overcome some challenges in

FIFA is the game that defined the football experience, creating the foundation that all future games are built on. Introduced in its seventh iteration, FIFA has grown to encompass the countless ways you can play the beautiful game on your favorite gaming platform. The present invention pertains to a generic element for the sealing of pipes against the ingress of water and a rotary flow valve. In order to prevent the outflow of water from underwater piping systems into the water of the surrounding environment, i.e., from sinking ships, floating bodies, or diving vaults, rotary valves have been employed which have a generally rotating disk which is rotatable by an operating mechanism about an axis of rotation. The valve disk has a plurality of ports which are assigned to the supply pipes that lead to the rotary valve. Arranged rotatably on the rotary valve are a plurality of sealing elements which, upon rotation of the valve disk, are in sealing contact with the periphery of the respective ports assigned to the supply pipes. These sealing elements are in the form of brush bristles, of rubber rings, and of ring seals. The rotary valves of this type are usually used at least in part in water-tight fashion in rotary joints, i.e., the rotating parts of the pipe joint are constructed as rotary valves, which are connected to the respective pressure and supply pipes by axial throughbores. This construction ensures that, during operation of the rotary joint, water is kept out of the interior of the rotary joint by the sealing elements of the rotary valve. DE-OS 23 25 064 describes a rotary joint valve in which one of the throughbores in the joint body is expanded as a so-called balloon-type bore. The associated sealing elements are in the form of brush bristles, which, upon a rotation of the valve disk, come into sealing contact with the expanded balloon-type bore. DE-OS 26 15 555 discloses a rotary joint valve in which, in the joint body, a bore is formed as a pot-shaped recess. In this case, the sealing elements are formed as so-called pot brushes which, by rotation of the valve disk, are brought into contact with the interior wall of the pot-shaped recess. The sealing elements of these conventional rotary valves are embodied in a variety of ways in order to ensure an optimal sealing effect. German Utility Model 29,70,669 discloses a rotary joint in which a
