Applying filters Filters are the special effects of your photo editing program. You can crop, intensify, soften, darken, lighten, sharpen, and alter color. Filters can make just about any photo look like it was shot by a pro. Photoshop offers a variety of filters. Some of them you see in Figure 10-1, such as the multipass filter, are multipurpose filters that you use for all kinds of projects. Others, such as the noise filter, are more specialized. Keep the following in mind when using any type of filter: * Save a copy of the original image before applying filters to avoid mistakenly including the filter's effect in the final image. * To preview the result of a filter, use the Adjustment (Ctrl+I) menu option and select Filter⇒Filter Gallery. You see a preview of the image after applying the filter you're using.

Q: How to find the median from a java code I have written a method which uses the quickselect algorithm to find a number within an array. How can I find the median of this array? static int[] medians(int[] ar) { int i, j, tmp, tmp2; int swap; for (i = 0; i tmp2) { swap = tmp; tmp = tmp2; tmp2 = swap; } ar[j] = tmp; } } I am trying to find the median of an array that is randomly generated. A: There are two basic approaches, both involved. You can use the first approach (and assume that the array is sorted) or the second approach (and assume that the array is in random order) to calculate the median. If you want to use the first approach (and assume that the array is sorted) then you should store the first half of the array (called A[0..n/2]) and the second half of the array (called A[n/2..n-1]) to create a sorted array. Then just calculate the median of the first half of the array using quickselect as you have done. You can have the program return the value you've calculated (like the median) or a new array (or arraylist) of values that correspond to the median. The array of values can either be stored in a variable or simply returned.
