Effect of diltiazem on coronary collateral blood flow during acute and chronic coronary occlusion. We investigated the effect of acute and chronic coronary occlusion on collateral blood flow in dogs using the radioactive microsphere technique. Acute occlusion (1 h) decreased collateral blood flow by 20% in the left circumflex coronary artery compared to the nonoccluded artery. No occlusion for 7 days reduced collateral blood flow in the circumflex coronary artery by 24%. During chronic occlusion, six of eight dogs developed collateral blood flow in the circumflex coronary artery, while the other two developed collateral blood flow in the right coronary artery. When six of the eight dogs in which collateral circulation developed in the circumflex coronary artery were subjected to acute occlusion 7 days later, collateral blood flow was increased during occlusion in the circumflex coronary artery by 23%. This increase in collateral blood flow was

accompanied by a decrease in arterial pressure (p less than 0.05) and an increase in heart rate (p less than 0.05). It is concluded that the major effect of c6a93da74d
